U.S.S.N. 10,788,912

Claim Amendments

Please amend claims 1, 8, 13, and 18 as follows:

U.S.S.N. 10,788,912

Claims as Amended

1. (currently amended) A method for forming a copper dual damascene with improved copper migration resistance barrier layer thickness uniformity and improved electrical resistivity comprising the steps of:

providing a substrate comprising upper and lower dielectric insulating layers separated by a middle etch stop layer comprising multiple layers;

forming a dual damascene opening by first forming a via extending through a thickness of the upper and lower dielectric insulating layers;

then forming an upper trench line portion extending through the upper dielectric insulating layer thickness and partially through the middle etch stop layer thickness including an uppermost layer comprising the middle etch stop layer;

then blanket depositing a barrier layer comprising at least one of a refractory metal and refractory metal nitride to line the dual damascene opening;

U.S.S.N. 10,788,912

then removing a bottom portion of the barrier layer to reveal an underlying conductive area according to a plasma etching process, said plasma etching process further improving said barrier layer thickness uniformity along trench and via sidewalls; and,

then filling the dual damascene opening with copper to provide a substantially planar surface.

2. (original) The method of claim 1, wherein the middle etch stop layer comprises at least two different material layers including a lowermost layer and an uppermost layer.

3. (original) The method of claim 1, wherein the middle etch stop layer comprises at least two different material layers selected from the group consisting of silicon nitride, silicon oxynitride, silicon carbide, and silicon oxycarbide.

4. (original) The method of claim 1, wherein the middle etch stop layer comprises a lowermost layer selected from the group consisting of silicon nitride and silicon oxynitride and an uppermost layer selected from the group consisting of silicon

U.S.S.N. 10,788,912

carbide, and silicon oxycarbide.

5. (original) The method of claim 1, wherein the middle etch stop layer comprises a silicon oxynitride lowermost layer and a silicon carbide uppermost layer.

6. (original) The method of claim 1, wherein the barrier layer is selected from the group consisting of Ta, Ti, W, TaN, TiN, WN, and TaSiN.

7. (original) The method of claim 1, wherein the barrier layer consists essentially of a Ta/TaN composite layer.

8. (currently amended) The method of claim 1, wherein the step of blanket depositing is selected from the group consisting of a PVD process and an ion metal plasma (IMP) process.

9. (previously presented) The method of claim 1, wherein the step of removing a bottom portion comprises a remote plasma etch treatment.

10. (previously presented) The method of claim 9, wherein the remote plasma etch treatment comprises one of an RF and microwave

U.S.S.N. 10,788,912

power source.

11. (original) The method of claim 1, wherein the underlying conductive area comprises copper.

12. (original) The method of claim 1, wherein the step of filling the dual damascene opening with copper comprises the steps of:

depositing a copper seed layer;

carrying out an electro-chemical deposition process to fill the dual damascene opening with a copper filling; and,

carrying out a CMP process to remove at least the copper filling portion overlying the dual damascene opening level.

13. (currently amended) A method for forming a copper dual damascene with improved copper migration resistance and improved electrical resistivity and barrier layer thickness uniformity comprising the steps of:

providing a substrate comprising upper and lower dielectric insulating layers separated by a composite middle etch stop

U.S.S.N. 10,788,912

layer;

forming a dual damascene opening by first forming a via extending through a thickness of the upper and lower dielectric insulating layers;

then forming an upper trench line portion extending through the upper dielectric insulating layer thickness and partially through a thickness of the middle etch stop layer;

then blanket depositing a barrier layer comprising at least one of a refractory metal and refractory metal nitride to line the dual damascene opening;

then carrying out a remote plasma etch treatment of the dual damascene opening to remove a bottom portion of the barrier layer to reveal an underlying conductive portion, said remote plasma etch further improving said barrier layer thickness uniformity along trench and via sidewalls; and,

then filling the dual damascene opening with copper to provide a substantially planar surface.

U.S.S.N. 10,788,912

14. (original) The method of claim 13, wherein the composite etch stop layer comprises a lowermost layer selected from the group consisting of silicon nitride and silicon oxynitride and an uppermost layer selected from the group consisting of silicon carbide, and silicon oxycarbide.
15. (original) The method of claim 13, wherein the composite etch stop layer comprises a silicon oxynitride lowermost layer and a silicon carbide uppermost layer.
16. (original) The method of claim 13, wherein the barrier layer is selected from the group consisting of Ta, Ti, W, TaN, TiN, WN, and TaSiN.
17. (original) The method of claim 13, wherein the barrier layer consists essentially of a Ta/TaN composite layer.
18. (currently amended) The method of claim 13, wherein the step of blanket depositing is selected from the group consisting of a PVD process and an ion metal plasma (IMP) process.
19. (original) The method of claim 13, wherein the remote plasma etch treatment comprises a remote plasma generator disposed

U.S.S.N. 10,788,912

upstream of an etch process chamber.

20. (original) The method of claim 13, wherein the remote plasma etch treatment comprises one of an RF and microwave power source.

21. (original) The method of claim 13, wherein the underlying conductive area comprises copper.

22. (original) The method of claim 13, wherein the step of filling the dual damascene opening with copper comprises the steps of:

depositing a copper seed layer;

carrying out an electro-chemical deposition process to fill the dual damascene opening with a copper filling; and,

carrying out a CMP process to remove at least the copper filling portion overlying the dual damascene opening level.
